Tester Name: Mehreen Iftikhar
Testing website: Digitech Offerings

URL: https://digitech-offerings-185302913428.asia-south1.run.app/index.html

Execution Date 20/5/2026 Version(0.0.1)

Bug ID	Located	Summary	Steps to Reproduce	Expected Result	Actual Result	Priority	Severity	Issue Type	Platform	Evidence	Reference Link
BUG_01	Global Lead Generation Modal Triggered via GET STARTED	Modal Container Session Reset Lifecycle	1. Open the website landing page and click the 'GET STARTED' primary CTA. 2. Fill out all mandatory fields in the 'START A PROJECT' multi-step wizard and click submit. 3. Wait for the 'Message Received!' success screen layer to display. 4. Attempt to click on 'SCHEDULE A CALL' or 'PARTNERSHIP' tabs from the top menu line.	Activating alternative wizard navigation tabs must dynamically wipe the previous success hook lifecycle and unmount old components to serve clean, empty input templates.	The modal context completely hard-locks on the success message state. Top tab buttons highlight on user click events, but the lower content pane fails to re-render without a hard manual browser refresh (Cmd + Shift + R).	High	Blocker	Functional	Web	https://www.loom.com/share/b75ad04a0a054b97b025fbe36f33a2cb	
BUG_02	Schedule a Call' & 'Partnership' Dropdown Component Modules	Form Data Binding Sync Lifecycle	1. Initialize either the 'Schedule a Call' or 'Partnership' form layers. 2. Click submission triggers while entries are blank to consciously force active inline error text indicators. 3. Click on a target dropdown select box (e.g., 'What would you like to discuss?') and select a valid list entry (e.g., 'Web or Mobile App').	Capturing an interactive input variant or focus selection event must instantly flush active data validation error flags under that element.	Major data sync failure. Even though the chosen parameters fill the selector field box accurately, the underlying logic component refuses to re-evaluate conditions, keeping the red 'Please select a topic' false exception notice fixed on screen.	High	Critical	Functional Bug	Web	https://loom.com/i/607bd2a764de4c158e18abecde48d0dc	
BUG_03	START A PROJECT' Form Module Step 02	Service Category Selection Component	1. Launch the 'START A PROJECT' modal wizard funnel and advance through Step 01 inputs to view Step 02 panels. 2. Attempt to point and mouse-click over individual operational value containers (AI & ML, Cloud, DevOps, Cybersecurity).	Scope indicators are expected to handle selection actions, dynamically working as operational check-boxes or button nodes that pass selected strings into final data payloads.	The text element wrapper handles zero action items. The boxes sit as completely static textual blocks, leaving users unable to choose or declare target project fields.	High	Critical	Functional Logic / Missing Feature	Web	https://www.loom.com/share/ee1de55ce5854824ae845abc070ff107	
BUG_04	START A PROJECT' Form Module Step 03 Budget Estimation Matrix	Project Delivery Urgency Pricing Logic	1. Advance inside the project creation modal through to the Step 03 setup view block. 2. Locate the timeline execution toggle chips and click 'ASAP (Under 4 weeks)'. 3. Observe numeric tracking strings above the main interactive budget slider.	Enforcing urgent delivery conditions must communicate with the dynamic value range text layer to inject premium project pricing tier parameters.	The value range calculation is totally passive. Toggling alternative urgent parameters applies zero price variants to the text output, breaking standard financial estimation workflows.	Medium	Major	Business Logic	Web	https://www.loom.com/share/83fdb1b2c55649bf865dbd076e2978b7	
BUG_05	Global First Name and Last Name Data Processing Lines	Identity Fields Text Masking Constraint	1. Open any input segment within the lead capture form systems. 2. Type numbers inside name target regions (e.g., type 'IFTIKHAR12' into the Last Name box). 3. Execute submit validations.	Identity components should process input characters using strict text-only regex filters, outputting validation failure cues on detecting integers.	Complete lack of data verification limits. The text boxes smoothly process numbers and symbols without displaying any input data mismatch warnings.	Medium	Major	Data Integrity	Web	https://www.loom.com/i/ee82200fc76d47b58b8ab2e12e922235	
BUG_06	PARTNERSHIP' Structural Data Forms Full Name Field	Full Name Character Threshold Limit	1. Open the 'PARTNERSHIP' registration menu tab layer. 2. Input a single alphabet character string ('M') into the 'Full Name' field box. 3. Fill other parameters with valid dummy values and hit the submission trigger button.	The identity controller layer must demand baseline name string thresholds (e.g., requiring at least a minimum of 3 characters) before declaring processing clearance.	Form parameters pass baseline checks flawlessly, accepting inadequate name strings without outputting minimum character error alerts.	Medium	Major	Input Processing Logic Fault	Web	https://www.loom.com/i/ee82200fc76d47b58b8ab2e12e922235	
BUG_07	Global Lead Processing Wrapper Frame Upper Title Blocks	Error Layout Top Header Overlap	1. Launch the 'PARTNERSHIP' or 'Schedule a Call' form template structures. 2. Execute a premature submit event while input areas are unassigned to fire all error rows. 3. Examine the top descriptive title line tracking block details on the frame header.	Responsive layouts must preserve parent box heights using flexible parameters, or use a scroll view to stop text components from breaking outer container limits.	The text content moves straight upwards into dark boundary blocks. Upper sentence strings (e.g., 'Explore reseller, white-label...') get clipped, cutting text readability.	Low	Minor	User Interface Layout Defect	Web	https://loom.com/i/607bd2a764de4c158e18abecde48d0dc	
BUG_08	Action Submission Footer Row Green CTA Component Box	CTA Button Viewport Grid Collision	1. Access the 'Schedule a Call' template panel block. 2. Force form errors to generate multiple lines of active validation error warnings beneath fields. 3. Check the lower-right baseline grid positioning layout of the green 'BOOK MY CALL' button.	Primary buttons must stay easily accessible, keeping secure padding spaces away from surrounding card container boundaries.	Vertical layout shifts squeeze the green button container outside the viewport boundary line, clipping the bottom text layout and corners.	Low	Minor	UI Spacing Layout Shift	Web	https://www.loom.com/i/48099ed056954575985a4abd22751c15	
BUG_09	Global Application User Interface Layout Layer	Custom Magnetic Cursor Trailing Lag	1. Move the mouse across any active section of the website layout canvas view. 2. Speed up movement speeds across layout items and notice the asynchronous trailing vector trail path.	User interaction pointer dots should trace across coordinate layouts smoothly, matching real-time user click trajectories cleanly without a noticeable trailing delay.	The outer decorative ring lags way behind the native cursor dot. This creates an asynchronous, jerky animation lag effect that looks distracting during navigation.	Low	UI Flaw	User Experience	Web	https://www.loom.com/share/0c078ed184ad4eb2a6479825dd69eddd	
BUG_10	Services Page Sub-Route Layout Wrapper Header	Services SubRoute Mobile Viewport Overflow	1. Open Google Chrome DevTools on your browser, select mobile responsive view, and assign the layout viewport to an iPhone 14 Pro Max. 2. Navigate directly to the Services sub-route path (/services). 3. Check the visibility tracking of the navigation bar's right-hand corner. 4. Attempt to swipe horizontally across the screen layout.	Mobile views must lock horizontal scroll paths (overflow-x: hidden). The top menu must adjust instantly, pinning the Hamburger Menu trigger in plain view for quick access.	The layout introduces an irritating horizontal scroll track. The global header stretches wider than the viewport width, hiding the primary Hamburger Menu (3 Lines) entirely off-screen to the right unless a user swiping motion is executed.	High	Critical	Mobile Responsiveness	Mobile (iPhone 14 Pro Max)	https://loom.com/i/1450fda4d81b4da1ae22cae8b85deb09	
BUG_11	About Us: Mobile Operational Viewport	Team carousel component framework suffers from overflow leakage, showing partial fragments of adjacent cards on mobile screen resolutions.	1.Open Chrome DevTools, select responsive mobile devices testing grid, and emulate an iPhone 13 Pro Max screen layer. 2. Direct user path coordinates onto the About Us module directory (/about-us). 3. Scroll down directly to locate the 'Our Team' graphic slider display matrix row. 4.Observe card rendering properties on step transitions.	Mobile viewports must strictly restrict multi-card renders, centering one single isolated element inside viewport coordinates safely with edge clips hidden completely.	Severe layout responsive bounds tracking failure. Adjacent profile boxes bleed directly over parent borders, presenting overlapping design frames to site end-users.	High	Critical	Mobile Responsiveness	Mobile Viewport Simulation Emulators, iphone 13 pro max	https://loom.com/i/c498d8a988ab40118cd6adb88d4a48d7	
BUG_12	Client page: Mobile Resolution Viewport	Excessive vertical white-space separation block generated between layout header text components on mobile viewports.	1. Access the application system via active Chrome responsive emulators configured to an iPhone 13 Pro Max viewport layer. 2. Direct user navigation steps onto the active clients subdirectory route. 3. Analyze the vertical design flow layout positioning matching top section headers.	Title layout sections must stack elegantly under each other with controlled, consistent padding intervals to retain screen space data density.	Layout metrics break consistency rules. The interface introduces an unproportional, massive vertical spatial gap, making users execute excessive scrolling actions just to hit the first data card.	Low	Minor	Responsive Padding Misconfiguration	Mobile	https://loom.com/i/af69650abac44696b6eee9f1485260f8	
BUG_13	Contact Us Page	Extremely weak email validation regex allows broken syntax entries (e.g., 'a@.com') to successfully bypass safety validations and proceed to Step 02.	1. Direct navigation tokens onto the live Contact Us module contact-us. 2. Locate the hard-coded embedded wizard component on the right-hand panel view. 3. Inside the 'Email Address' mandatory input field, type exactly: a@.com 4. Fill out random stub data in other fields and click on the 'Next Step' prompt link trigger.	The core form validation parser must reject any broken or non-standard email structures, firing an implicit error message layer like "Please enter a valid email address structure.	System validation fails entirely. The client-side controller accepts the dummy syntax pattern as a clean string and forces a layout state transition to the secondary form view deck.	High	Major	Input Validation Failure	Desktop	https://www.loom.com/share/0d97ea9b004041bd9b0d6278f1a7a1ac	
BUG_14	Contact Us Route Layout contact-us: Mobile Breakpoint Screen	Embedded form category tabs freeze entirely on mobile devices, making them non-clickable and blocking user selection workflows.	1. Access the live /contact-us route using a mobile breakpoint simulation. 2. Locate the upper navigation chips (START A PROJECT, SCHEDULE A CALL, PARTNERSHIP). 3. Attempt to tap or mouse-click on alternative tabs to trigger form switching.	The responsive tabs must actively handle touch/click inputs, dynamically updating the lower form states to match the selected category.	System Blocker. The component ignores all interactive tap attempts. The tab interface remains rigidly stuck on the initial state, preventing any alternate form submissions.	High	Block	Mobile Responsiveness	Mobile Viewport Simulations (Android)	https://www.loom.com/share/b4999527050641b984b1db337dd525b2	
BUG_15	Contact Us	Heavy Cumulative Layout Shift (CLS) rendering defect triggers structural form content dislocation under simulated 3G network throttling.	1. Access the application staging system using active Chrome developer console panel view configurations. 2. Switch the device viewport simulation option dropdown to target an iPhone 14 Pro Max layout interface profile. 3. Inside the DevTools Network management panel strip, modify parameters from No Throttling directly to Fast 3G or Slow 3G. 4. Perform a hard reload command r Cmd + Shift + R on the active view layout page. 5. Observe the structural integrity layout shifting rules of the onboarding forms row component while assets fetch.	Form modules must load cleanly within rigid flex safe blocks, maintaining structural positioning boundaries regardless of underlying network asset delivery speeds.	Severe layout shift failure. The slow-loading assets drop components downwards, creating a massive empty dark gap placeholder at the top panel layers and ruining visual alignment metrics.	High	Medium	Dynamic Layout Shift Flaw	Mobile	https://www.loom.com/share/32577c9f67ae47578cc3d111964d5f7a	
BUG_16	Global Embedded Forms Module: Offline Exception Handlers	Critical security and state logic leak. System bypasses network exception states, rendering a fake success panel ("Message Received!") during active offline modes instead of blocking client requests.	1. Open the contact-us route or any interactive lead capture wizard form modal. 2. Switch the active network dropdown parameter inside the Chrome DevTools interface to Offline. 3. Populate all mandatory form inputs Name, Email, Company, Project Details with standard test character strings. 4. Click the final 'Submit' or verification trigger button link. 5.Click browser back button parameters and re enter form routes to check session view memory states.	The application system must run an internal network connection ping verification logic. On catching an offline state exception, it must completely block form submission, stop step routing, and explicitly warn the user: "Network error. Please check your internet connection."	The local client framework fakes submission execution, immediately routing the session profile to show the premium validation summary success window view "Message Received!" without a network connection. Old data caches linger persistently in layout rows upon back navigation loops until a native hard reload (Cmd + R) is executed.	High	High	Network Handling	Mobile	https://www.loom.com/share/b3a9de61e8994fcfa49f107267c18ae7	
BUG_17	About Us Page	Heavy optimization gap detected on mobile viewports, dragging performance layers down to 74 orange zones compared to 94 desktop green score metrics.	1. Open Google PageSpeed Insights web panel tool context. 2. Paste the active temporary cloud run deployment URL for the target sub-route (/about.html). 3. Execute 'Analyze' processing routines and toggle results between the Desktop and Mobile score sheets tabs.	Mobile performance scores must mirror optimized rendering frameworks, ideally maintaining a standard threshold baseline of 90+ green scores.	Mobile rendering speed metrics drop down heavily to 74, indicating core main thread execution blockages caused by raw uncompressed asset loads or unoptimized layout component execution times.	Medium	Medium	Page speed	Page speed insight	https://loom.com/i/588234eba98947db895af156b05523ce	https://pagespeed.web.dev/analysis/https-digitech-offerings-185302913428-asia-south1-run-app-about-html/smb0wbhlpy?form_factor=mobile
BUG_18	Contact Us Route Page Accessibility Audits	Form input structure accessibility constraint failures drop desktop accessibility metrics down to an 87 orange warning zone.	1. Open Google PageSpeed Insights engine tracking tools. 2. Input the destination link pointing to the target embedded contact directory path contact-us. 3. Trigger structural audits and track elements data inside the 'Accessibility' metrics panel rows.	Application interfaces must enforce high color contrast guidelines and strict semantic input label parameters, ensuring a minimum green standard baseline score of 90-100.	he page locks at an 87 score due to minor frontend contrast deviations, missing screen-reader tags on wizard inputs, or raw layout label omission warnings.	Medium	Minor	Accessibility Compliance Gap	Page speed insight	https://loom.com/i/fb845399e0c142b9b2ed6433ccc53379	https://pagespeed.web.dev/analysis/https-digitech-offerings-185302913428-asia-south1-run-app-contact-html/4jb86q90fv?form_factor=mobile
BUG_19	Home Page Desktop Performance Defaults	Index landing root directory page score experiences a severe optimization regression on desktop viewports, dropping down to a 75 orange warning metric benchmark.	1. Open PageSpeed Insights web evaluation tool platform. 2. Enter the absolute index URL tracking path for the website application staging system (/). 3. Run performance analysis audits and capture results under the active 'Desktop' view metrics column row.	Home page default desktop performance configurations must maintain optimal, standard delivery parameters, hitting a green baseline target threshold score of 90+.	Desktop performance drops to 75 due to heavy render-blocking script assets, unoptimized hero banner graphic layers, and high script execution latencies on initial load threads.	High	Medium	Speed Optimization Defect	Page speed insight	https://loom.com/i/636e94beca0747f2b3e5bdbf0f70f1c4	https://pagespeed.web.dev/analysis/https-digitech-offerings-185302913428-asia-south1-run-app-index-html/6du99gg2s6?form_factor=desktop
